## **Executive Summary**

The California Department of Transportation District 9 conducted an Origin and Destination study during the months of February, March and August of 2000. The purpose of the study was to obtain sound information about trip movements and travel patterns on US 395 in Inyo and Mono Counties in order to plan future transportation needs and project future economic growth.

As was done in a 1989 District 9 study, Caltrans personnel conducted roadside interviews with vehicle occupants at four major entry points in the winter and six major entry points in the summer both on and feeding into US 395 in Inyo and Mono Counties as shown in Figure 1. Upon approach of a vehicle into a survey area, the person conducting the survey recorded the vehicle type; the remaining questions on the sheet were asked of the driver of the vehicle. A copy of the survey questions is shown in Figure 2. Another person conducted a complete count and classification of all the vehicles that passed the cordon point. Both the interview and vehicle classification operations took place between 7AM and 5PM in the winter and 7AM and 7 PM in the summer.

The Questions asked in this study included:

1. Number of persons per vehicle
2. Type of vehicle they were driving
3. Where the trip originated
4. What the final destination of the trip was
5. Main purpose of the trip
6. How often they stop in small communities for services other than gas
7. What town they will be staying in Inyo or Mono Counties only
8. The length of their stay
9. The type of facility they will be staying in
10. The type of commodity trucks are hauling

Significant findings from the responses to the questionnaires are shown below:

- Average occupancy per vehicle was 2.18
- Autos and Sport Utility Vehicles (SUV's) made up 54% of the vehicles surveyed
- 11.5% of the vehicles were commercial trucks
- RV's made up 3.2% of the vehicle mix
- Recreation was given as the main purpose of the trip by 55% of the respondents
- 42% of the overnight visitors were staying in a motel or hotel versus 37% staying in a campground

- Nevada accounted for 24% of the vehicles coming into the Eastern Sierra
- 36% of the vehicles came from Southern California
- 1% of the travelers came from out of the country
- Germany was number one foreign country of origin
- 60% of the people named Inyo or Mono County as their destination
- 40% of the travelers were driving through the Eastern Sierra to reach their final destination without staying overnight
- Mammoth lakes was the number one destination at 41% of the visitors staying in Inyo and Mono Counties
- The majority (69%), of overnight visitors stay in Mono County
- 72% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights with the majority of visitors staying 1 night
- 31% of the traveling public said they always stop in small communities for services other than gas; 48% said they sometimes stop; and, 21% said they never stop

# Survey Locations

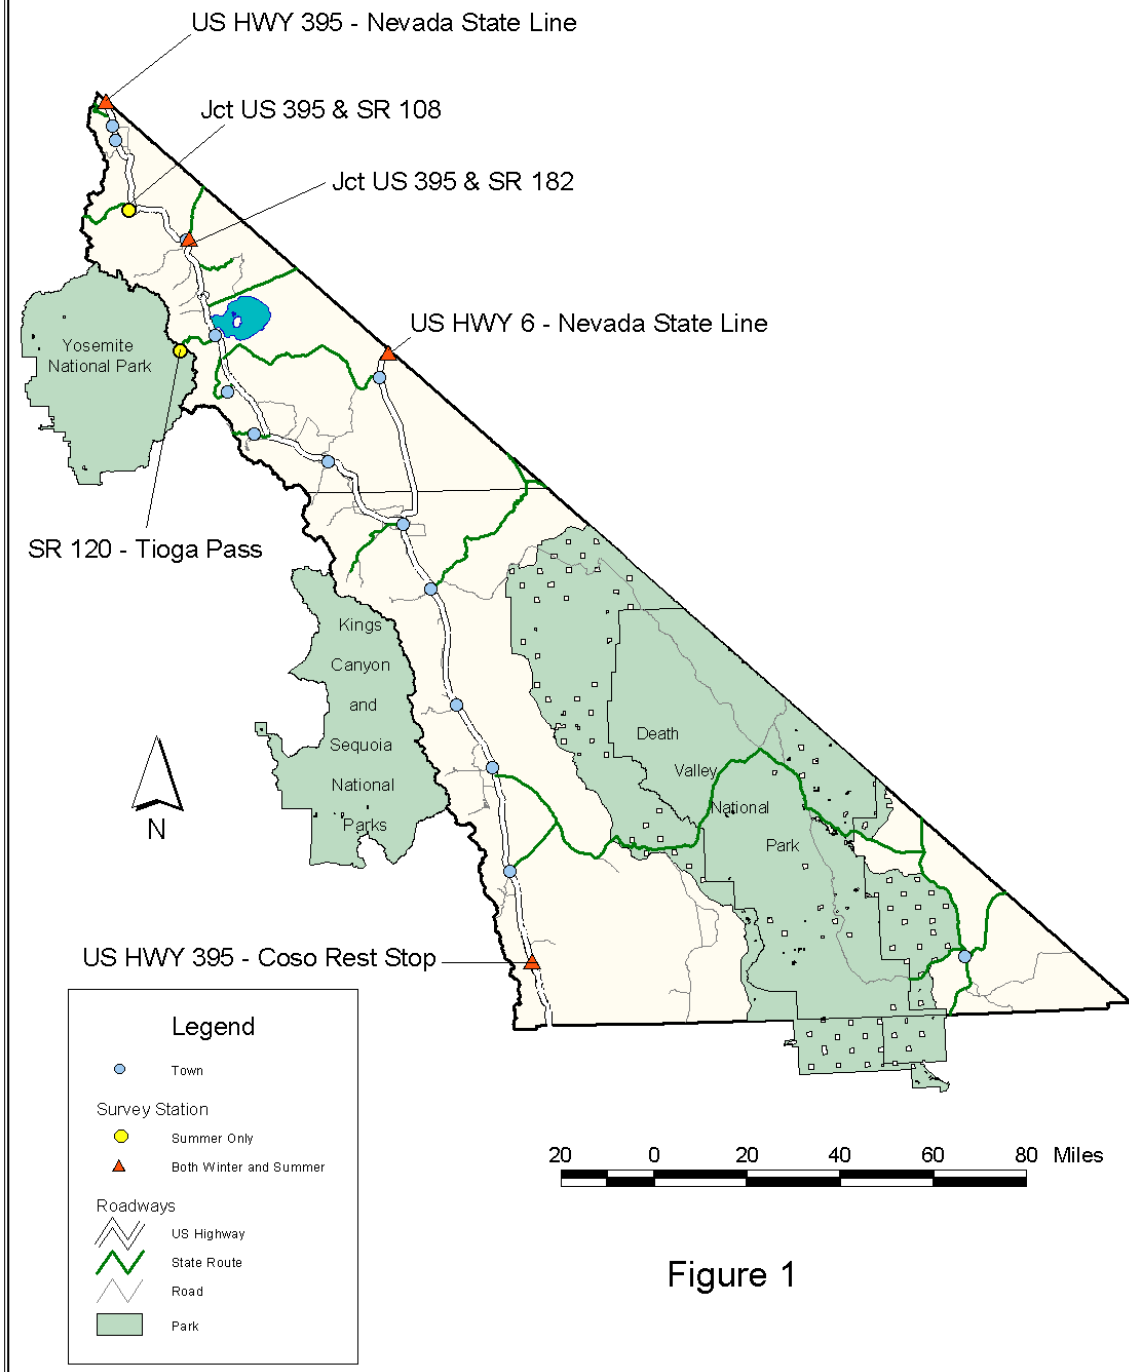

Figure 1

# Introduction

The Year 2000 O&D study is the third in a series of decennial surveys of the traveling public using the US 395 corridor in Inyo and Mono Counties.

The study covered by this report is designed to provide information on travel patterns on US 395, the principal arterial in the Eastern Sierra, and its minor arterial feeders into and within Inyo and Mono Counties. It also details the number and types of vehicles using US 395 and its feeders. Travel trends will be determined, where possible, through comparing data to that obtained in the previous surveys. Not only will this information be of use to Caltrans for planning purposes: it can be used to advantage by a number of public agencies and governmental entities in the area.

Caltrans District 9 undertook past studies in 1979 and 1989. As is the case for the year 2000 study, among the goals of the other two studies was the determination of the number and vehicle types utilizing US 395 as well as those traversing minor arterial roads feeding into the US 395 corridor. Although the range and type of data desired are similar, the sources of data, time periods that data are taken, and the specific data taken differ among the three (1979, 1989, and present) surveys. The general format developed for the 1989 survey was used as the basis for the method of collection and evaluation of the current round of roadside data.

Survey locations for the year 2000 study are shown on Figure 1. Both the Topaz Agricultural Inspection Station and the area just south of the Coso Junction Safety Rest Area were used for both the 1989 and current studies. In 1979, the northernmost location monitored outbound (northbound) traffic on US 395 north of its south junction with State Route 158 near June Lake. The southernmost location was on US 395 south of Olancho. At this location both northbound and southbound traffic were monitored. These spots correspond to Topaz and Coso, respectively, in the Year 2000 study, but they are not fully comparable because of the differences in locations.

## METHODOLOGY

The following table is a comparison of the manner in which the 1979, 1989 and 2000 surveys were conducted.

### O&D Study Characteristics 1979-2000

Survey Season	Winter	Summer	Winter	Summer	Winter	Summer
Year	1979		1989		2000	
Surveys Collected	1,550	3,320	3,849	12,912	5,128	15,188
Number of Locations	3	8	2	4	4	6
Survey Dates	2/16-3/3	6/15-7/2	2/2-2/12	8/19-8/22	2/23-3/3	8/2-8/18
Number of Days	4	4 or 2 <sup>1</sup>	1 or 2 <sup>1</sup>	3	2	2
Interview Hours	8 AM-6 PM	8 AM-6PM	8 AM-5PM	8 AM-5PM	7AM-5PM	7AM-7 PM
Duration of Mechanized count	24 hours		Not applicable		24 hours	
Direction of Travel	Outbound		Inbound		Inbound	
Source of Survey Data	Mailed out/mailed back questionnaires and a mechanized count		Roadside interviews and manual counts		Roadside interviews and manual and mechanized counts	

1. In summer, 1979 and winter, 1989 the number of days varied from survey site to survey site.

### 1979 Survey

Survey personnel recorded license plate numbers of outbound vehicles from Inyo and Mono Counties. From the plate IDs, the Department of Motor Vehicles provided the registered owners' name and address. A questionnaire was then mailed to each registered owner. A consultant helped prepare and evaluate the information and tabulated the responses. A total of 4,870 questionnaires were received from the winter and summer surveys, a 34 percent response to the questionnaires sent out.

The surveys for both winter and summer were conducted from 8AM to 6PM as well as during one 24-hour period. The winter survey took place on the last two Fridays, Saturdays, Sundays, and Mondays of February. The summer survey was conducted on the last three Fridays, Saturdays, Sundays, and Mondays of June. In addition to the outbound vehicle license plates being recorded, vehicles in both directions were classified as to vehicle types for each 10-hour, 8AM to 6PM, period. Each twenty-four hour survey consisted of an axle count via a portable mechanized counter. The twenty-four hour surveys took place during one of the same weekends the ten-hour surveys were in progress.

## **1989 Survey**

The procedure for the 1989 study involved personal interviews with vehicle occupants at six survey locations, as well as recording the type of vehicle passing each survey station. The six survey stations were located on major routes coming into Inyo and Mono Counties. Classification counts were done for the entire 24-hour period of each survey day.

The winter survey was conducted on a neutral February mid-week day and the following Friday and Saturday of the Presidents Day weekend. Neutral is defined as non-weekend and non-holiday. The summer survey was conducted on a neutral August mid-week and the following Friday and Saturday. The surveys were conducted from 8AM to 5PM. Listed below are the questions that were asked at the survey sites:

1. How many in vehicle?
2. Type of vehicle – classification (recorded from direct observation)
3. Location of residence
4. Purpose of trip
5. Will you be staying in Inyo or Mono County?
6. If yes, at what type of facility?

The total number of vehicles surveyed in the 1989-travel study was 16,761.

## 2000 Survey

Similar to the 1989 study, Caltrans personnel conducted roadside interviews with vehicle occupants at six major entry points both on and feeding into US 395 in Inyo and Mono Counties as shown in Figure 1. Upon approach of a vehicle into a survey area, the person conducting the survey recorded the vehicle type; the remaining questions on the sheet were asked of the driver of the vehicle. Figure 2 is a copy of the survey question sheet. Another person conducted a complete count and classification of all of the vehicles that passed the cordon point. Both the interview and vehicle classification operations took place between 7AM and 5 PM in winter and 7 AM and 7 PM in summer.

The total number of vehicles surveyed at all the stations in the summer (2000) travel study was 15,188 while the winter totaled 5,128. The dates for the winter and summer surveys were chosen to avoid holidays in order to get average weekday and weekend analysis. (According to Caltrans headquarters, surveys should not be done on holidays unless the purpose of the study is to determine travel patterns on holidays). For the 2000 survey, Wednesdays and Thursdays were the weekday sampling dates and Fridays, Saturdays and Sundays were the weekend sampling dates. The original intent was to conduct the surveys on Wednesdays and Fridays to give a representative sampling of weekday and weekend travel.

The first three weeks of August were used for the summer survey and the last week of February and first week of March were used for the winter. The dates for the surveys were picked to coincide with the dates of the surveys done in 1979 and 1989 so that comparative analysis of the results of the three surveys may be completed.

To determine the location of roadside interview stations, the 1998 traffic counts on US 395 entering Inyo and Mono Counties as well as the inbound traffic counts on all major (higher-traffic-volume) routes intersecting US 395 in Inyo and Mono Counties were examined. For this survey, a sample of 90 percent of the total 1998 traffic inbound on US 395 was deemed necessary to provide a suitable sample. Ranking the entry points from highest volume to lowest volume, it was determined that the 90% cut-off figure could be obtained by using the top four survey stations.

## Tioga Station SR 120 & Yosemite Park Boundary

## Topaz Station US 395 and Nevada State Line

## Sweetwater Station Jct. US 395 and SR 182

## OVERALL COMBINED RESULTS

The following are results that were obtained from the survey questionnaire. More detailed results comparing data by station are available in Tables I – V

### Number of Passengers Per Vehicle

The number of passengers per vehicle averaged 2.18 for all the survey stations combined. Vehicle occupancy has declined from a high of 2.69 that was calculated in 1979.

The numbers ranged from a low of 1.83 at Benton to 2.73 at the Tioga survey station.

Distribution of Passengers Per Vehicle  
Winter & Summer Combined

Note: Does not include the number of passengers on buses

### Type of Vehicle

Sport Utility Vehicles (SUVs) made up 20% of the vehicle mix. Autos and SUVs combined to make up 53.5% of the all the vehicles surveyed. Commercial truck traffic entering the US 395 corridor accounted for 11.5 % of the vehicular traffic. The percent of RV's dropped from 15.3% in 1989 to 3.2% in the year 2000 study.

Percent of Vehicles by Type  
Winter & Summer Combined

## Trip Origination

A substantial number of vehicles (28%) came from Nevada and other states. Previous studies have shown that only 15% of the vehicles come from out of the state.

Travelers from other countries made up 1% of the vehicle mix, with Germany being the number one country of foreign origin.

Southern California that includes the South Coast Zone combined to make up 36% of the vehicles entering the survey areas. This compares to previous studies that concluded that 75% of the vehicles came from Southern California.

## Trip Destination

Sixty percent of the respondents indicated that their final destination was in either Inyo or Mono Counties. Forty percent of the travelers surveyed were driving through Inyo and Mono Counties to reach their final destination. Nevada was the number one destination for these travelers at 11%.

Surprisingly 8% of the vehicles were destined for the Central zone. The Central zone includes Yosemite, Central Valley and the Bay Area with the easiest access being Tioga and Sonora Pass in the summer.

The destinations of all other states combined made up 3%. For an enlarged map of destination zones in Inyo and Mono Counties see Figure 5.

## Main Purpose of Trip

Almost 55% of the people surveyed, named recreation as the main purpose of their trip. Work was the number two response given at 13.2%. Only 7.9% of the respondents listed going home as their main purpose of their trip. Percentages for recreation ranged from a high of 87.1% at Tioga Pass to only 22.7% at the Sweetwater survey station near Bridgeport.

## How Often Do You Stop In Small Communities for Services Other Than Gas?

Forty-eight percent of the traveling public said they sometimes stop in small communities while 31% said they always stop.

## What Town Will You Be Staying In?

Mammoth Lakes was the preferred destination of 41% of the overnight visitors for winter and summer combined. Bishop was second with 19.4% of visitors spending 1 night or more in Inyo or Mono County. Sixty-nine percent of visitors staying in the Eastern Sierra stayed in Mono County.

Staying Overnight	Number of People	Percent
Big Pine	101	1.7
Bishop	1165	19.4
Bridgeport	751	12.5
Coleville	33	0.5
Crowley Lake	6	0.1
Furnace Creek	69	1.1
Independence	75	1.2
June Lake	396	6.6
Lee Vining	338	5.6
Lone Pine	404	6.7
Mammoth Lakes	2467	41.0
Olancho	25	0.4
Toms Place	101	1.7
Topaz	87	1.4

Overnight Destinations Inyo and Mono Counties Winter & Summer Combined

## What Type of Facility Will You Be Staying In?

The preferred choice of facility for visitors staying at least one night in Inyo or Mono County was a motel/hotel with 42.2% of visitors giving this response. Camping was the number two response with a 36.5% share of visitors.

Type of Facility (Visitor Only)  
Winter & Summer Combined

## **How Long Will You Be Staying?**

Combining the winter and summer surveys shows that 72% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights with most staying 2 nights. Thirteen percent of the visitors indicated they were going to stay for an entire week or more. This was especially true in the summer when 15% of the visitors said they were spending a week or more in Inyo or Mono Counties.

## **Truck Commodities**

Overall 11.5% of the vehicles entering the survey areas were commercial trucks. Benton recorded the highest percentage of commercial trucks of all the survey stations at 43%.

Water was the largest type of commodity being hauled into or through Inyo and Mono Counties, followed by hay, french fries and retail goods.

Table VI shows a detailed breakdown of the types of commodities. For the purpose of this study, the North American Industry Classification System (NAICS) was used to breakdown the types of commodities being hauled by commercial trucks. NAICS is the official classification system used in the United States. Every five years the NAICS system is reviewed and updated, so classifications can keep pace with the changing economy.

## **Conclusions**

The percentage of visitation from Southern California has continued to decline since the first study was done in 1979. The present study shows that only 36% of the vehicles were from Southern California compared to 75% in 1979 and 56% in 1989. At the same time the percent of visitation from out of state has increased from 15% in 1979 to 28% in 2000. This is especially true for the state of Nevada. Nevada now accounts for 24% of vehicular traffic entering the US 395 corridor. Average vehicle occupancy has fallen substantially from 2.7 in 1979 to 2.18 in the current study.

Commercial truck traffic has increased significantly from the 2% recorded in the 79 and 89 studies to 11.5% in 2000. Recreational vehicle traffic has dropped significantly from 13.4% in 1989 to only 3.2% in the present study. This may be attributed to the fact that this study was not done on a holiday, whereas the 1989 study was. This corresponds well with the fact that the percentage of visitors camping has dropped from 43.8% to 36.5% in the same time period. Recreation continues to be the main reason why people visit the Eastern Sierra but the percentage has dropped from 79.7% in 1989 to 54.7 in the 2000 study.

The percent of total visitors to the Eastern Sierra staying overnight in Mono County stayed steady from 1979 to 1989 at approximately 64%, but jumped to 69% in 2000. Mammoth Lakes continues to be the main destination in Mono County. Seventy-two percent of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights in 2000 compared to 68% in 1979.

## Lessons Learned

1. To better determine where people are from, future studies may include asking where the respondents live. This may be accomplished by using zip codes or asking them what city they live in.
2. At the Coso Junction survey station extreme care should be used in determining how to set up the survey lanes with safety being the first priority. A drawing of where flagmen and interviewers are going to be positioned should be reviewed by maintenance and planning before setting up. The Highway Patrol needs to be present at all times and should be positioned near where the surveyors are standing while still being visible to incoming traffic.
3. On Wednesday 8/16/00, traffic was much heavier than anticipated at the Tioga Pass (SR 120) survey station; thus more interviewers were needed for Friday. From this study it is recommended that at least eight interviewers be used for future surveys at this location.
4. In the pre-survey meeting it should be stressed to all interviewers that anytime a commercial truck is empty they must ask what they are hauling normally.
5. In the future it may be helpful to record all the vehicles that refused to respond to the questionnaire so that more accurate counts can be obtained.
6. Because several survey sheets were missing answers to some of the questions, the principal investigator should stress that each interviewer should try to receive answers for every question. Where possible, survey forms should be reviewed for completeness by the station supervisor shortly after they are filled out, to check and capture any missing data.
7. As many of the interviewers had a difficulty determining the type of vehicles with the classifications as given on the survey form, an action was required to improve efficiency of the interview process. Therefore, the summer survey form was changed so that the word semi was placed in front of truck & 1 trailer and truck & 2 trailers.
8. Because respondents were having difficulty differentiating between the three answers to the question "How often do you stop in small communities for services other than gas?" on the survey form, action was required to improve the efficiency of the interview process. Therefore the answers were expressed as percentages and the word "seldom" was changed to "sometimes" to be more understandable.

9. Many of the vehicles surveyed were observed passing through the survey site on Route 182 several times. A large number of the locals were annoyed at having to be stopped while driving into town. Some even went out of their way to go around. To minimize annoyance of local residents and improve the efficiency of data collection, consideration was given to relocating the survey site on Route 182 from between the central business district and the largest housing development in Bridgeport to an area just north of the reservoir. However, it was decided not to move the site for the year 2000 summer survey because of the difficulty of comparing the data between the winter and summer surveys. Should a location along Route 182 be required or desired for a subsequent survey, extra consideration should be given to the effects of site selection has on local traffic, the efficiency of the survey, and the potential skewing of survey results.
10. Due to lack of interviewers, only 65.6 percent of the vehicles traveling north past Coso Rest Area were interviewed in the present effort. Changes were made to the summer survey to increase the number of interviewers at this location in order to facilitate the flow of vehicles and to survey a larger percentage of the vehicles.
11. The category of condo was added to the summer survey form in question H “What type of Facility will you be staying in?” Many people gave condo as their answer to this question. Those responses were put in the category of “other” in the winter survey.

**WINTER 2000**

**ORIGINATION & DESTINATION**

**REPORT**

## EXECUTIVE SUMMARY

The California Department of Transportation District 9 conducted an Origin and Destination study during the months of February and March of 2000. The purpose of the study was to obtain sound information about trip movements and travel patterns on US 395 in Inyo and Mono Counties in order to plan future transportation needs and project future economic growth.

Similar to the 1989 study, Caltrans personnel conducted roadside interviews with vehicle occupants at four major entry points both on and feeding into US 395 in Inyo and Mono Counties. Upon approach of a vehicle into a survey area, the person conducting the survey recorded the vehicle type; the remaining questions on the sheet were asked of the driver of the vehicle. A copy of the survey questions is shown in Figure 1. Another person conducted a complete count and classification of all the vehicles that passed the cordon point. Both the interview and vehicle classification operations took place between 7AM and 5PM.

The Questions asked in this study included:

1. Number of persons per vehicle
2. Type of vehicle they were driving
3. Where the trip originated
4. What the final destination of the trip was
5. Main purpose of the trip
6. How often they stop in small communities for services other than gas
7. What town they will be staying in
8. The length of their stay
9. The type of facility they will be staying in
10. The type of commodity trucks are hauling

Significant findings from the responses to the questionnaires are shown below:

- Average occupancy per vehicle was 1.95
- Autos and SUV's made up 56% of the vehicles surveyed
- 13% of the vehicles were commercial trucks
- RV's made up 1% of the vehicle mix

### Origination - Total Vehicles

- Nevada accounted for 30% of the vehicles coming into the Eastern Sierra
- 42% of the vehicles came from Southern California
- 72% of the people named Inyo or Mono County as their destination
- Inyo and Mono County residents made up 29% of the people surveyed
- 28% of the travelers were driving through the Eastern Sierra to reach their final destination
- Mammoth Lakes was the number one destination at 78% of the visitors staying in Inyo or Mono Counties
- 82% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights with the majority of these staying 2 nights
- 45% of the traveling public said they always stop in small communities for services other than gas; 37% said they seldom stop; and, 18% said they never stop.
- Recreation was listed as the main purpose of the trip by 39%
- 57% of the overnight visitors were going to stay in a motel or hotel

The following are comparisons from 1979, 1989 and 2000 surveys:

- The percent of total visitors to the Eastern Sierra staying overnight in Mono County stayed steady from 1979 to 1989 at approximately 64%, but jumped to 84% in 2000
- The percentage of RVs has continued to drop from a high of 14% in 1979, to 7% in 1989 to the present 1%
- Vehicle Occupancy has declined from 2.69 in 1979, to 2.49 in 1989 to the present 1.95

## 2000 Winter Survey

The total number of vehicles surveyed at all the stations in the winter (2000) travel study was 5,128. The dates for the winter and summer surveys were chosen to avoid holidays in order to get average weekday and weekend analysis. (According to Caltrans headquarters, surveys should not be done on holidays unless the purpose of the study is to determine travel patterns on holidays). For the 2000 winter survey, Wednesdays and Thursdays were the weekday sampling dates and Fridays, Saturdays and Sundays were the weekend sampling dates. The original intent was to conduct the surveys on Wednesdays and Fridays to give a representative sampling of weekday and weekend travel. An exception to these days occurred because of inclement weather at the Coso station. The survey scheduled for 2/23 was cancelled and rescheduled for Thursday 2/24.

The last week of February and the first week of March were used for the winter survey. The dates for the surveys were picked to coincide with the dates of the surveys done in 1979 and 1989 so that comparative analysis of the results of the three surveys may be completed.

To determine the location of roadside interview stations, the 1998 traffic counts on US 395 entering Inyo and Mono Counties as well as the inbound traffic counts on all major (higher-traffic-volume) routes intersecting US 395 in Inyo and Mono Counties were examined. For this survey, a sample of 90 percent of the total 1998 traffic inbound on US 395 was deemed necessary to provide a suitable sample. Ranking the entry points from highest volume to lowest volume, it was determined that the 90% cut-off figure could be obtained by using the top four survey stations. See Table VIII for specific information.

The Coso Junction survey station surveyed 65.6 percent of all traffic traveling north past the Coso Rest Area, while the other survey stations captured nearly 95 percent of the traffic in the surveyed direction (see Table VII). Occupants who declined to be interviewed were not counted thus accounting for the differences between the classification count and the survey count. The lower percentage captured at Coso is directly related to the fact that the volume of traffic at Coso was comparatively higher. For example, on 2/25 from 4PM to 5PM, 286 vehicles were classified at the Coso station compared to a high of 126 at the Topaz station for the same period. For safety reasons, only a limited number of vehicles, including trucks, were allowed to enter the survey area. Five or six flagmen would direct some vehicles to pass the survey site without being stopped. However, for statistical purposes, these bypassing vehicles were counted and identified by type by the person assigned to the continuous classification duty.

## Overall Winter Results

The following are results that were obtained from the survey questionnaire. More detailed results comparing data by station are available in Tables I – V.

### Number of Passengers Per Vehicle

The number of passengers per vehicle averaged 1.95. When comparing to the winter data in the 1979 study it is surprising to find that the number of passengers per vehicle dropped from 2.69 to the current 1.95. At the Coso survey station the average number of persons per vehicle increased from 2.13 on Wednesday to 2.33 on Friday, which indicates that the number of passengers increases on weekends due to winter recreational activities.

Note: Does not include the number of passengers on buses

### Type of Vehicle

A new category of vehicle, Sport Utility Vehicle (SUV) was added to this survey because of its increased market share of vehicles sold in the last few years. Interestingly, autos and SUV's made up 56 percent of the vehicles surveyed with each one making up 28 percent. Of regional significance is the volume of commercial truck traffic on the US 395 corridor, this accounted for 12.8 percent of the vehicles surveyed. RV's made up only 1 percent of the vehicle mix, which is much lower than expected, but the number should increase significantly in the summer survey.

For more specific vehicle classification details, see Tables IX - XVI.

## Trip Origination

The data on the origination of vehicles entering the survey showed some interesting results. For example, Nevada accounted for 30% of total vehicles coming into the Eastern Sierra. Out of the 60% of vehicles coming from California, Southern California accounted for 42%. In sharp contrast, travel studies in the past such as one completed by Caltrans in 1979 have shown that approximately 15% of the vehicles were from out of state and that almost 80% were from Southern California. See Figure 3 for an enlarged view of the map located on the right.

Idaho and Oregon each had 1% share of the total, while all other states combined added up to 3% of trip origination.

## Destination

Seventy-two percent of the respondents indicated that their final destination was somewhere in the Eastern Sierras. Inyo and Mono County residents made up 29% of that total. For the purpose of this report Inyo and Mono counties were broken up into major zones. A map of destination zones in Inyo and Mono Counties is given in Figure 4. Twenty-eight percent of the travelers surveyed were driving through Inyo and Mono Counties to reach their final destination outside of the Eastern Sierra. For these travelers, the southern zone was the number one destination with 8%. The destinations of all other states combined made up 2%. For an enlarged map of destination zones in California, see Figure 5.

## Main Purpose of Trip

Recreational travel was the primary purpose of the trip for a large proportion of people entering Inyo and Mono Counties, 39 percent of people surveyed gave this response. At the Coso survey station recreation was the primary purpose of the trip for 59 percent of vehicle occupants, which correlates to the high number of skiers coming from Southern California.

Only 9 percent of the respondents at the Benton survey station gave recreation as the main purpose of the trip. Work was the number one response at 38 percent primarily due to commercial trucks hauling commodities from Idaho and Nevada to the Eastern Sierra.

## How Often Do You Stop In Small Communities for Services Other Than Gas?

Eighteen percent of the traveling public said they never stop and spend money in local communities. This may be attributed to the fact that 28 percent of the travelers surveyed were driving through Inyo and Mono Counties to reach their final destination outside the Eastern Sierras.

## What Town Will You Be Staying In?

Since this survey was taken during winter, it appears the majority of these visitors were skiers and outdoor enthusiasts, which helps explain why Mammoth Lakes was the overwhelming destination in Inyo and Mono counties. Bishop was a distant second at only 11% and all other towns combined made up the final 11%. Inyo and Mono County residents were not included in this data. The majority (84%), of overnight visitor's stay in Mono County. When comparing these figures with the 1979 visitor survey, Inyo County's share of overnight visitors has dropped dramatically from 36% in 1979 to 16% in 2000.

Staying Overnight	Number of People	Percent
Big Pine	4	0.5%
Bishop	95	10.7%
Bridgeport	5	0.6%
Coleville	6	0.7%
Furnace Creek	27	3.0%
Independence	3	0.3%
June Lake	28	3.2%
Lee Vining	3	0.3%
Lone Pine	14	1.6%
Mammoth Lakes	693	78.2%
Olancho	2	0.2%
Toms Place	2	0.2%
Topaz	4	0.5%

Overnight Destinations Inyo and Mono Counties

## What Type of Facility Will You Be Staying In?

Over half (57%) of the visitors who were going to spend at least one night in Inyo or Mono County stayed in a motel/hotel. Camping only accounted for 6%, which should show a dramatic increase in the summer survey.

For the purpose of this survey, the category "other" included condos and or second homes which explains the reason why that category had such a high percentage.

Type of Facility (Visitor Only)

## **How Long Will You Be Staying?**

The survey indicates that 82% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights, with the majority of these visitors staying 2 nights, which is likely due to the visitors staying the weekend. Three percent of visitors indicated they were going to stay for an entire week or more.

## **Truck Commodities**

Commercial trucks accounted for 13% of all vehicles entering the survey area. Benton station results showed that 45% of all vehicles were trucks, which is much higher than the other survey station results. The Topaz station recorded 8% trucks which is a significant increase from the results of the 1989 study that found only 0.5 % of the vehicles were trucks. Fourteen percent of all trucks surveyed were semi-trailers that were empty

Water was the largest type of commodity being hauled by commercial trucks. Empty water trucks traveling through the Coso location to the Crystal Geyser water plant in Olancho accounted for the majority of the truck traffic. Hay; french fries and onions were the next most common type of commodities being transported by truck through the Eastern Sierra. At the Benton station, commercial trucks from Idaho carrying french fries accounted for the majority of the trucks.

Table VI shows a detailed breakdown of the types of commodities. For the purpose of this study, the North American Industry Classification System (NAICS) was used to breakdown the types of commodities being hauled by commercial trucks. NAICS is the official classification system used in the United States. Every five years the NAICS system is reviewed, so classifications can keep pace with the changing economy.

## **Conclusions**

This study has demonstrated that Nevada has become a major factor in the origination and destination of vehicles traveling in the Eastern Sierra. The largest numbers of vehicles still originate in Southern California, but the number has dropped significantly since the last studies were conducted. Recreation is still and will continue to be the main reason people travel to Inyo or Mono Counties. Motels were the preferred choice of facility by 57% of the visitors surveyed. Mammoth Lakes share of overnight visitors has increased dramatically to 78% since the 1979 and 1989 travel studies.

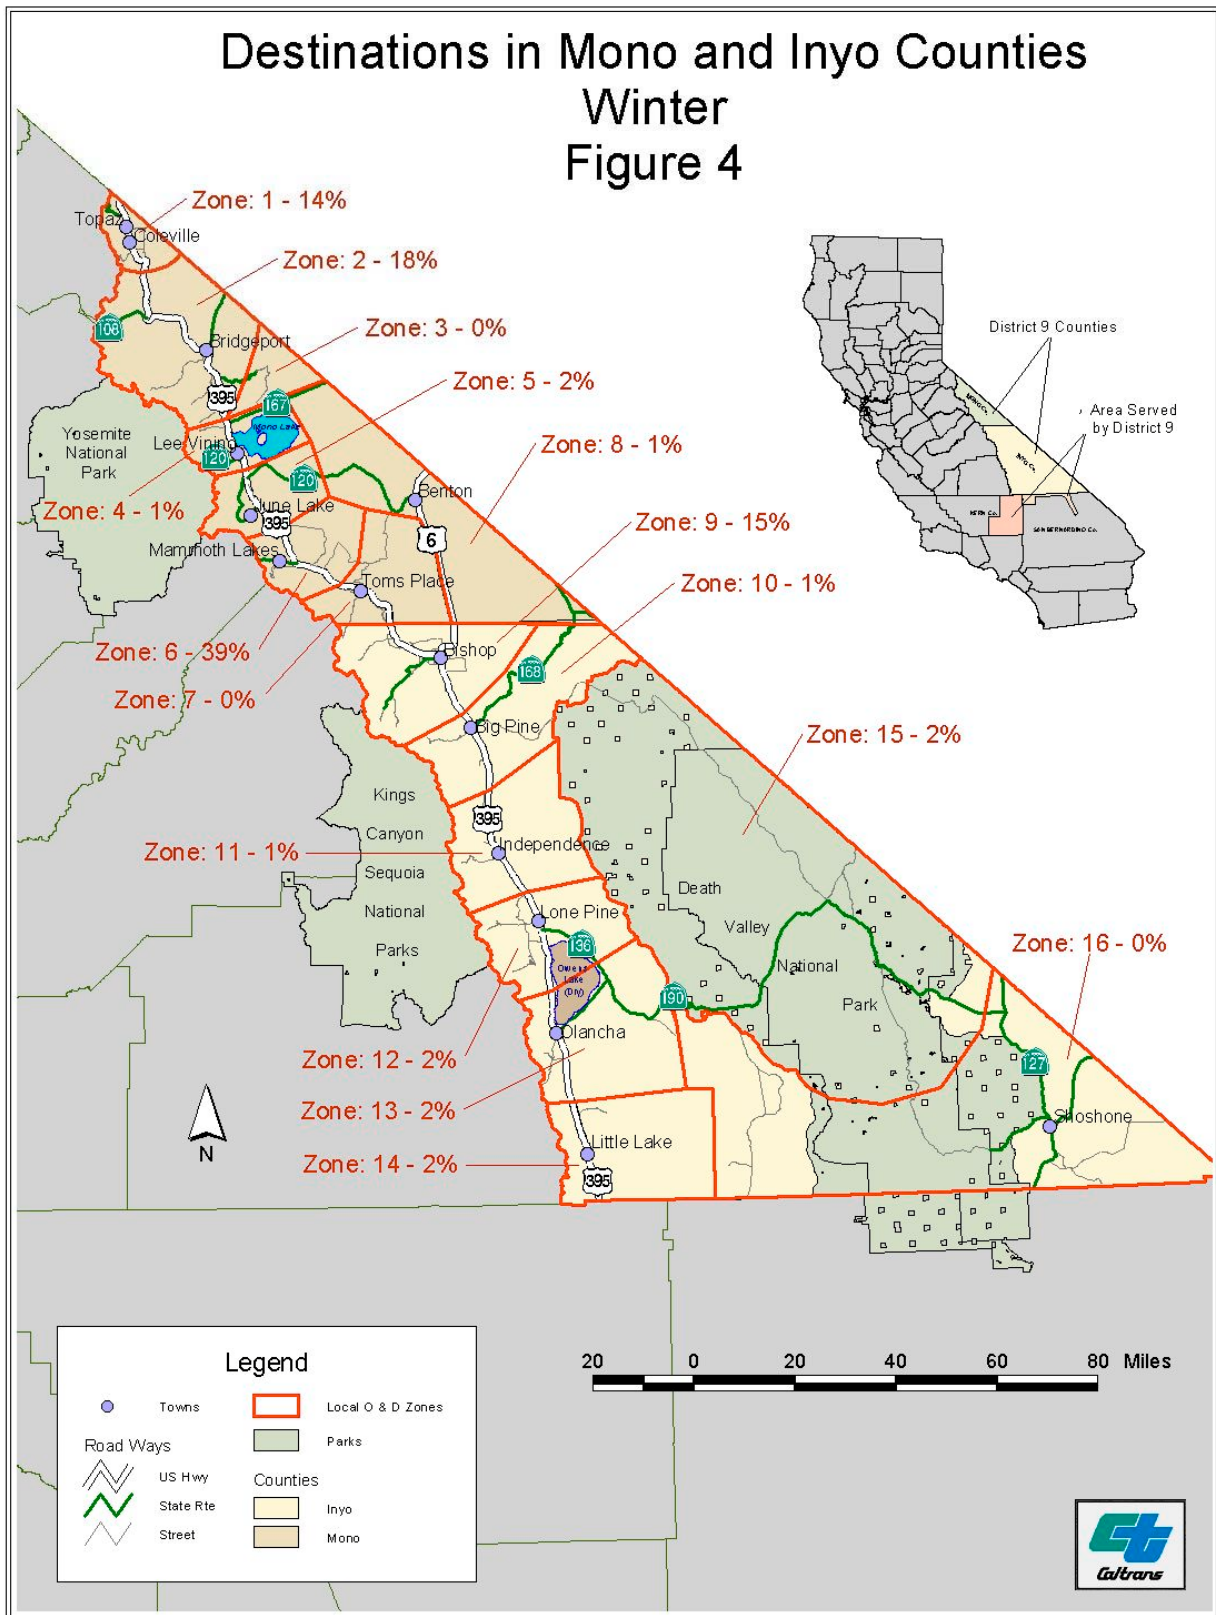

The average vehicle occupancy has continued to drop from the past studies and is now at 1.95. Commercial truck traffic is increasing at a rapid pace as US 395 continues to be improved. This study showed that commercial trucks made up 13 % of the vehicle mix compared to less than 1% in 1989.

**ATTACHMENT B**

**SUMMER 2000**

**ORIGINATION & DESTINATION**

**REPORT**

## **Executive Summary**

The California Department of Transportation District 9 conducted an Origin and Destination study during the month of August of 2000. The purpose of the study was to obtain sound information about trip movements and travel patterns on US 395 in Inyo and Mono Counties in order to plan future transportation needs and project future economic growth.

As was done in a 1989 District 9 study, Caltrans personnel conducted roadside interviews with vehicle occupants at six major entry points both on and feeding into US 395 in Inyo and Mono Counties. Upon approach of a vehicle into a survey area, the person conducting the survey recorded the vehicle type; the remaining questions on the sheet were asked of the driver of the vehicle. A copy of the survey questions is shown in Figure 1. Another person conducted a complete count and classification of all the vehicles that passed the cordon point. Both the interview and vehicle classification operations took place between 7AM and 7PM.

The Questions asked in this study included:

1. Number of persons per vehicle
2. Type of vehicle they were driving
3. Where the trip originated
4. What the final destination of the trip was
5. Main purpose of the trip
6. How often they stop in small communities for services other than gas
7. What town they will be staying in
8. The length of their stay
9. The type of facility they will be staying in
10. The type of commodity trucks are hauling

Significant findings from the responses to the questionnaires are shown below:

- Average occupancy per vehicle was 2.22
- Autos and Sport Utility Vehicles (SUV's) made up 53% of the vehicles surveyed
- 11% of the vehicles were commercial trucks
- RV's made up 3.9% of the vehicle mix
- Recreation was given as the main purpose of the trip by 60% of the respondents
- 24.4% of the overnight visitors were staying in a campground versus 24.2% staying in a motel or hotel

- Nevada accounted for 22% of the vehicles coming into the Eastern Sierra

- 34% of the vehicles came from Southern California

- 2% of the travelers came from out of the country

- Germany was number one country of origin

- 56% of the people named Inyo or Mono County as their destination

- 44% of the travelers were driving through the Eastern Sierra to reach their final destination

- Mammoth lakes was the number one destination at 34% of the visitors staying in Inyo and Mono Counties

- The majority (68%), of overnight visitors stay in Mono County

- 69% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights with the majority of visitors staying 1 night

- 26% of the traveling public said they always stop in small communities for services other than gas; 52% said they sometimes stop; and, 22% said they never stop

**Origination - Total Vehicles**

## **2000 Summer Survey**

The total number of vehicles surveyed at all the stations in the summer (2000) travel study was 15,188. The dates for the winter and summer surveys were chosen to avoid holidays in order to get average weekday and weekend analysis. (According to Caltrans headquarters, surveys should not be done on holidays unless the purpose of the study is to determine travel patterns on holidays). For the 2000 summer survey, Wednesdays and Thursdays were the weekday sampling dates and Fridays, Saturdays and Sundays were the weekend sampling dates. The original intent was to conduct the surveys on Wednesdays and Fridays to give a representative sampling of weekday and weekend travel.

The first three weeks of August were used for the summer survey. The dates for the surveys were picked to coincide with the dates of the surveys done in 1979 and 1989 so that comparative analysis of the results of the three surveys may be completed.

To determine the location of roadside interview stations, the 1998 traffic counts on US 395 entering Inyo and Mono Counties as well as the inbound traffic counts on all major (higher-traffic-volume) routes intersecting US 395 in Inyo and Mono Counties were examined. For this survey, a sample of 90 percent of the total 1998 traffic inbound on US 395 was deemed necessary to provide a suitable sample. Ranking the entry points from highest volume to lowest volume, it was determined that the 90% cut-off figure could be obtained by using the top four survey stations. See Table VIII for specific information.

The Tioga Pass survey station surveyed 83 percent of all traffic traveling east through the Yosemite Entrance Station, while the other survey stations captured nearly 95 percent of the traffic in the surveyed direction (see Table VII). Occupants who declined to be interviewed were not counted thus accounting for the differences between the classification count and the survey count.

***"Thank you very much for your cooperation. Have a nice trip."***

## OVERALL SUMMER RESULTS

### Number of Passengers Per Vehicle

The number of passengers per vehicle averaged 2.22. This is an increase from 1.95 found in the winter survey. At the Coso survey station the vehicle occupancy was 2.13 on Wednesday and 2.33 on Friday, which was identical to the winter study. The Tioga survey station had the highest vehicle occupancy at 2.73.

### Type of Vehicle

As expected the percent of Recreational Vehicles (RV's) increased from 1.0 in winter to 3.9 in summer. These numbers are still much lower than the 14.7 recorded in the 1979 summer study and 15.3 in the 1989 summer study. The highest percentage of RV's occurred at the Tioga Pass survey station at 5.9%. Commercial truck traffic made up 11.1% compared to 12.8 percent in the winter. SUV's dropped significantly from 28% in winter to 17.2 percent in summer.

## Trip Origination

It is interesting to find that 23% of the vehicles originated in the Central Zone. This compares to only 4% in the winter most likely due to the closure of both State Route 120 and State Route 108.

Southern California including the South Coast Zone combined to make up 34% of the vehicles entering the survey areas. Past studies such as the one conducted in 1979 show that 75% came from Southern California. See figure 3 for an enlarged view of the map located on the right.

A big difference between summer and winter was that 2% of the respondents in summer came from out the country versus 0% in the winter. Germany was the number one country of foreign origination.

## Destination

Fifty-six percent of the respondents indicated that their final destination was in either Inyo or Mono County. For a detailed map of these zones see Figure 4.

Forty-four percent of the travelers surveyed were driving through Inyo and Mono Counties to reach their final destination. Nevada was the number one destination for these travelers at 12%.

The Central zone increased from 1% in the winter to 10% in summer; most likely due to the use of Tioga and Sonora passes. For an enlarged map of destination zones in California, see Figure 5.

## Main Purpose of Trip

Recreation was the number one response given, when asked what the main purpose of their trip was. Recreation jumped dramatically from 39% in winter to 60% in summer. At the Coso Survey station recreation was the primary purpose of the trip for 66% of vehicle occupants. The Tioga Pass survey station showed that 87% of the people surveyed said that recreation was the primary purpose of their trip.

Only 37% of the respondents at the Benton survey station gave recreation as the main purpose of the trip. Business was the number two response at the Benton survey station.

## How Often Do You Stop In Small Communities for Services Other Than Gas?

Fifty-two percent of the travelers sometimes stop in small communities while 26% said they always stop. This compares to 37% and 45% in the winter.

## What Town Will You Be Staying In?

As was the case in the winter survey, Mammoth Lakes was the number 1 destination for overnight visitors. Bishop was second again, but increased from 11% in winter to 21% in summer. The numbers show that overnight visitors were spread out much more evenly throughout the district in the summer, which is probably due to the influx of visitors using camping facilities. Mono County still had the majority of overnight visitors (68%). When comparing the present survey with the 1979 visitor survey the results show that both counties had exactly the same share of overnight visitors.

Staying Overnight	Number of People	Percent
Big Pine	97	1.9
Bishop	1070	20.6
Bridgeport	746	14.4
Coleville	27	0.5
Crowley Lake	6	0.1
Furnace Creek	42	0.8
Independence	72	1.2
June Lake	368	7.1
Lee Vining	335	6.5
Lone Pine	390	7.6
Mammoth Lakes	1774	35.4
Olancho	23	0.4
Toms Place	99	1.9
Topaz	83	1.6

Overnight Destinations Inyo and Mono Counties  
Summer

## What Type of Facility Will You Be Staying In ?

As expected camping increased significantly from 6% in winter to 36.4% in the summer. The percent of visitors who were going to spend at least one night in Inyo and Mono Counties and stay in motel/hotel decreased from 57% in winter to 36% in summer.

It is interesting to note that the new category added in the summer, (condo) accounted for almost 11% of the responses.

Type of Facility (Visitor Only)

## **How Long Will You Be Staying ?**

The summer survey indicates that 69% of the visitors staying in Inyo and Mono Counties were going to stay 1-3 nights with most of those staying 1 night which may mean that many of these people were just traveling through. On the other hand the length of stay increased substantially in the summer with 15 % of the visitors staying for an entire week or more compared to the winter when only 3% were staying an entire week or more. This may be attributed to the fact that many of these visitors were camping for long periods of time.

## **Truck Commodities**

In the summer survey, commercial trucks accounted for 11% of all vehicles entering the survey area; this compares to 13% in the winter. The 1989 summer travel study indicated that only 2.8% of vehicles were commercial trucks. As in the winter study, Benton station had the highest percentage of trucks at 28%.

Water was the largest type of commodity being hauled by commercial trucks in the summer. Twenty percent of commercial trucks were transporting water with most of those stopping at the Crystal Geyser water plant in Olancho. Retail goods were the next most common types of commodity being transported through the Eastern Sierra with many of these trucks coming from distribution centers in Reno and Sparks, Nevada.

Table VI shows a detailed breakdown of the types of commodities. For the purpose of this study, the North American Industry Classification System (NAICS) was used to breakdown the types of commodities being hauled by commercial trucks. NAICS is the official classification system used in the United States. Every five years the NAICS system is reviewed and updated, so classifications can keep pace with the changing economy.

## **Conclusions**

The summer survey indicates that the largest number of vehicles still originate in Southern California, but that Central California has increased its share of visitors to the Eastern Sierra since the last surveys in 1979 and 1989 were done. Recreation is the main reason people travel to Inyo and Mono Counties which is one of the reasons why camping had the highest percentage of where people stayed. Mammoth Lakes was the destination for 34% of the overnight visitors to the survey area. The majority of overnight visitors named Mono County as where they were going to stay.

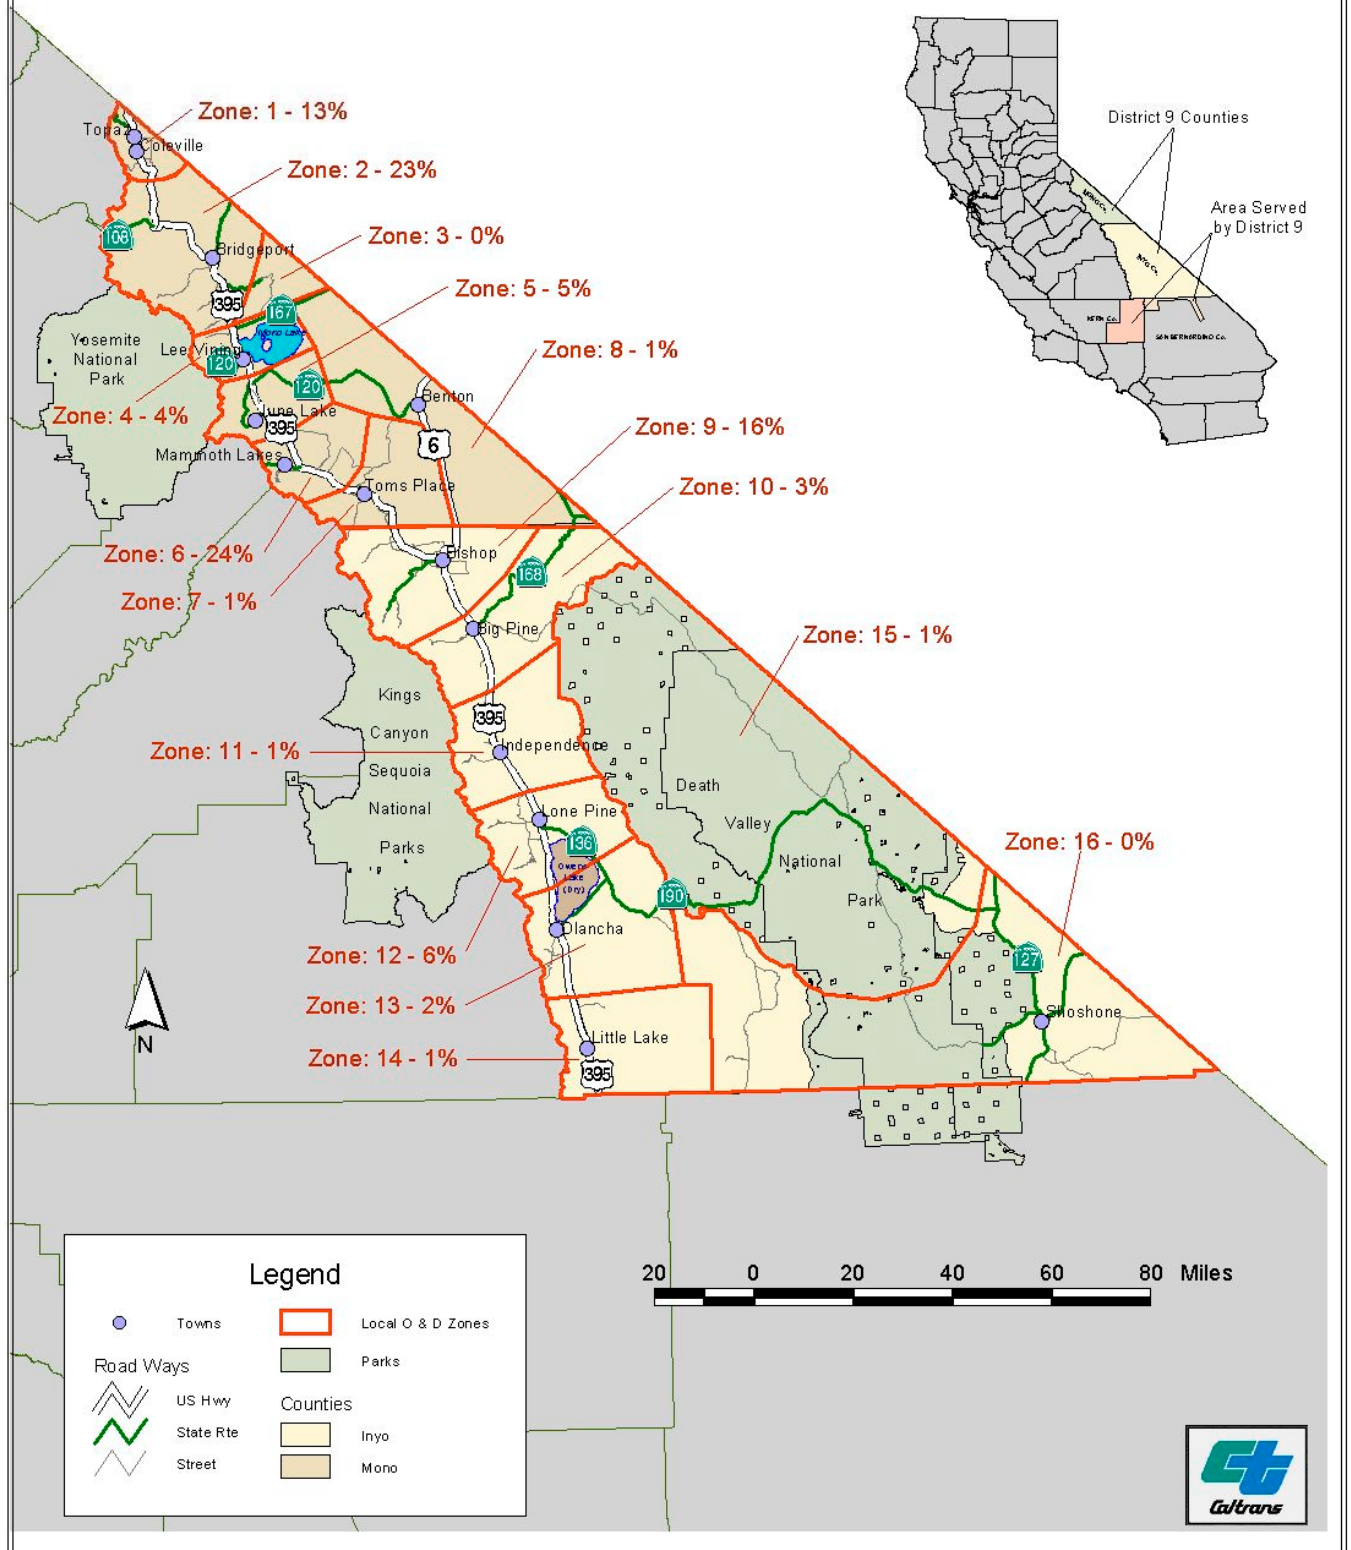

The average vehicle occupancy was 2.22, which is still comparatively lower than the 2.7 that has been given in previous studies. Commercial truck traffic remained relatively high at 11%, even with the increased traffic from recreationalists. Autos were the number one vehicle types used by the respondents. Surprisingly RV usage was determined to be only 4% compared to much higher numbers from the previous surveys in 1979 and 1989.
